

1           6.       (Twice Amended) A method of manufacturing a resistor comprising  
2 the steps of:

3           forming a pair of electrodes on a substrate; and

4           forming a resistor element between said pair of electrodes, said resistor  
5 element comprising i) rectangular sections connected to each of said pair of  
6 electrodes along a substantial portion of a length of said pair of electrodes along a  
7 width of said substrate and ii) a S-shaped section disposed between said  
8 rectangular sections, said S-shaped section being free of a trimming portion.

1           11.       (Twice Amended) A resistor comprising:

2           a substrate having a width shorter than a length of said substrate;

3           a pair of electrodes disposed on said substrate, said pair of electrodes being  
4 disposed on both end portions of said substrate along said length;

5           a resistor element situated between said pair of electrodes, said resistor  
6 element including:

7           a pair of side sections, each of said side sections connected to a respective  
8 one of said pair of electrodes along a substantial portion of a length of said pair of  
9 electrodes along said width, and

10          an S-shaped section situated between said pair of side sections;

11          wherein a width of said S-shaped section along said length of said substrate  
12 is less than a width of each of said side sections along said length of said  
13 substrate.
